

SYSTEM-H — recovery completion & preregistration repair

33/33 runtime identity gates · projection identity-exact · 0 runs consumed · reserve 0 bytes · head `f492f07` · 2026-09-04

Everything below passes, and that is the reason to read the last section first. The approved PASS floor is `case_hit@10 ≥ 0.8`. SYSTEM-H's own recovered historical result on a comparable natural-query set is **20/40** — roughly 0.50 at case level. **SYSTEM-H may well fail this run.** The floor is retained unchanged by coordinator ruling; this is recorded now so that outcome cannot later be presented as a surprise.

33/33 IDENTITY GATES	18,057 PROJECTIONS, EXACT	31/34 BUILD FIELDS IDENTICAL	0 RUNS CONSUMED	0 RESERVE LOG BYTES
-------------------------	------------------------------	------------------------------------	--------------------	------------------------

1 — The superseded preregistration is closed, not edited

State `SUPERSEDED_BEFORE_RUN_IDENTITY_AND_PRIOR_ANCHOR_CORRECTION` · old preregistration modified: **False**.

- It pins the wrong SYSTEM-H identity. It requires `score_determining_hash` `3fade96a9b3597861b0788c15d0e456a52fa92f6907749a2661960e54bf7b2e5`, a value minted locally over a local SYSTEM-H record. The `autho`
- It asserts that no prior SYSTEM-H benchmark result existed. That premise is false. EVAL-NATQ-VAL-001 scored the authoritative SYSTEM-H on NATQ-001 validation, `n=40`.

Recorded as a separate closure artifact so the superseded document keeps its own hash and its “written before any scoring” claim stays independently checkable. Editing it to fix its rationale would have destroyed the property that makes it evidence.

2 — Identity resolved

Identity	Hash	Status
Authoritative SYSTEM-H config hash	<code>7599eb3c3bb4798230a722e6a7c96b046dc36cc0332b584ec55339896b2d717a</code>	pinned
Local config hash	<code>026a302b56c18e50f3af1d6b7baba8d744da2c8b951eba9ac1e137d5cec9c491</code>	rejected
Local <code>score_determining_hash</code>	<code>3fade96a9b3597861b0788c15d0e456a52fa92f6907749a2661960e54bf7b2e5</code>	rejected

Neither local hash was reproduced or force-matched, and neither was attached to the authoritative frozen system. The recovered runner pins the authoritative hash in its own source, so the identity is self-verifying rather than asserted.

3 — Cross-encoder verified, and the decoy identified

The exact original is present at revision `233902d25c440f23af6f7d6e94d2946bac0bee0a` with SHA256 `5d3e70fd0c9ff14b9b5169a51e957b7a9c74897afd0a35ce4bd318150c1d4d4a` — matching the frozen value. Verified: **True**.

The locally cached `data/cache/models/exp009/model.onnx` hashes to `4f148ba8ae9c2c7fbee4af2b132db8d06c6a6545b47fc83bbb98c3d22b8393e6`. It is **not** the cross-encoder — it is the MiniLM *sentence encoder*. Earlier caution about it being unverified was warranted, and no substitution was made.

4 — Projection rematerialized, identity-exact

Original rows were absent from every database, backup and cache. The index was rebuilt with the recovered EXP-017 builder running against the recovered source tree, the same frozen corpus, and the same MiniLM bundle (`913d7300ceae3b2dbc2c50d1de4baac` a... , matching the encoder's own pinned value).

The config hash was computed and checked against the recorded value before any compute was spent. Only then was the build run.

Identity-determining fields — all identical to the recovered original

Field	Value
n_versions	202
n_windows_considered	18060
n_projections	18057
n_skipped_exact_single_canonical	3
n_covering_multi	12687
max_windows_in_one_doc	5158
embeddings_stored	18057
tokens_seen	8125103
token_coverage	1.0

The only three differences

Field	Original	Rebuilt
embed_seconds	831.6	1079.5
total_seconds	848.0	1103.8
window_seconds	10.8	16.2

Wall-clock timings only. 31 of 34 fields identical; config hash `7fd5034c9510a1e08ec76bd22b020703...` , count 18,057, fingerprint `bd95feaeacf98559` — all exact. The builder writes new tables only, and the scratch worktree was restored to pristine afterwards.

5 — Runtime identity gate: 33/33

Twelve code artifacts hashed against the recovered ref, seven configuration artifacts recovered, the upstream record's parent hashes cross-checked, the CE and embedding bundle verified, and the projection identity confirmed against the corpus. A failed gate does not write a manifest — the builder exits non-zero so a failure cannot be mistaken for a pass.

6 — Replacement preregistration EVAL-NATQ2-H-001

A replacement, not an edit. It pins the authoritative config hash, the runtime manifest, every benchmark and split hash, and the immutable BM25 comparator vector (case_hit@10 0.375, micro-MRR 0.1425).

Threshold provenance	State
PASS / FAIL floors	0.8 / 0.65
Changed	False
Chosen before any SYSTEM-H NATQ-002 score existed	True
Empirically derived from NATQ-002	True (i.e. not derived)
Historical NATQ-001 result known when written	True

They are engineering qualification floors. They are not estimates of expected performance and must not be described as statistical priors.

7 — Disclosed prior evidence, and what it implies

SYSTEM-H has been evaluated before. This is disclosed rather than implied absent. EVAL-NATQ-VAL-001 on NATQ-001 validation, n=40, 53 gold spans, config hash verified.

Metric	Result
strict_recall@10	20/40
evidence_span_recall@10	27/53 = 0.5094
document_recall@10	35/40
candidate_gold_span_recall@100	34/40

The approved PASS floor of 0.80 sits well above this historical ~0.50 case-level result on a comparable natural-query set. On that evidence SYSTEM-H may well fail the floor. The floor is retained unchanged by coordinator ruling; this note exists so that outcome cannot later be presented as a surprise.

NOT asserted to be definition-identical to NATQ-002 case_hit@10. No metric-definition audit has been performed. Treated as prior evidence and a historical anchor, not as a directly comparable number.

8 — State and constraints

Constraint	State
system h run	False
system h reconstructed	False
bm25 rerun	False
bm25 tuned	False
reserve opened	False
thresholds changed	False
old prereg modified	False
local hash force matched	False
split altered	False

Pinned hashes

ready_for_first_SYSTEM_H_NATQ2_run: True, pending coordinator approval. NATQ-002 has never been scored by SYSTEM-H; SYSTEM-H itself has been evaluated before, on NATQ-001. Those are different statements and the preregistration keeps them apart.
